

# Order in motion

Where do the cans go?

Try it out!

- In order to do so, build your own switches. Just cut out the handles and cut along the four dotted lines of each switch. Then, place the handles in the appropriate position.
- At the beginning, adjust the machine in a way that the lower track of each switch is open.
- Let the cans move through the machine one after another. Cross out the removed can from the queue and write down its number in the oval where it left the machine.
- What do you notice?
